

YOUR GUIDE TO SMART OBJECTS

CAFE BARRIERS

What are Smart Objects?

Smart Objects preserve an image's source content with all its original characteristics, enabling you to perform nondestructive editing to the layer.

How can this help me?

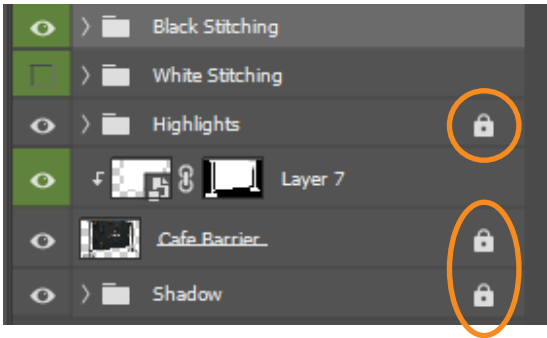

Smart Objects allow edits and a complete design overhaul in a matter of minutes saving you time and effort.

We have tried to make this process as effortless as possible with this step by step guide, we assure you its easier than it looks and you'll be changing artwork in and out in no time as we've done the hard work for you.

Step 1

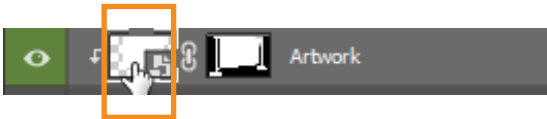

Open the downloaded PSD file in Photoshop. In the layers panel shown on the right you will see everything that makes up the Smart Object. You may see a padlock symbol to the right of a layer, this means its locked and you don't have to worry about it.

Tip: You can open the Layers Panel by going to: (Windows, Layers or F7)

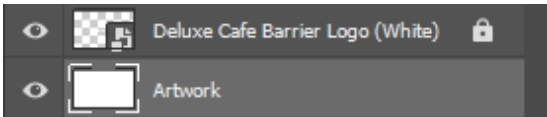

Step 2

Double click in the Smart Object image box. The Smart Object will open in a new window.

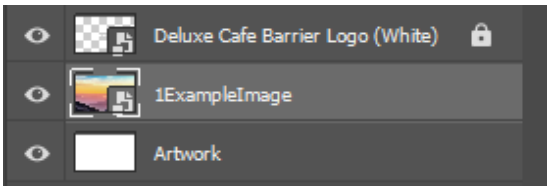

Step 3

In the new window, it should show one layer, which is the layer that you have just opened. Don't worry if you see an extra layer with the logo in or a shadow, this should be locked.

Step 4

Left Click on the Artwork layer then drag and drop your desired image onto the Photoshop document (Not in to the layers) Resize and position accordingly and hit enter, this will produce a third layer containing you artwork.

Step 5

Save the file and close with window.

Step 6

Revisit the original smart object file you started with. Your artwork should appear in the product. Depending on your artwork, you can change the colour of the stitching. The eye indicates next to the layer indicates which colour you are showing.
